

Kansas Immunization Registry

There are 3 ways to connect your pharmacy data to KSWebIZ:

1. Direct Entry (each user at your clinic has a login and manually identifies what vaccination was given)
2. HL7 2.5.1 Interface Real-Time (your electronic practice system sends data to the registry in real time, electronically, using HL7 2.5.1 interface messaging and connection)
3. HL7 2.5.1 Interface Batch (your electronic practice system extracts the required data, formats it using HL7 2.5.1 interface specifications, and uploads the file to the registry's direct portal for processing)

Attached you will find the most current registry HL7 messaging specs.

If you would like to schedule a kick off meeting or if you have questions please contact Brittany or I.
